# Surgeons Do Not Always Agree Where to Operate

The history of nearly every sufferer from chronic disease is that of having been kept in a mental state of uncertainty as to just what his disease might be. In the case of Miss Triplett she was credited with having four different diseases, and two different operations were advised, one for appendicitis and one for gall stones. Her parents were probably justified in refusing either.

The certainty of chiropractic is its chief recommendation. The chiropractor makes an analysis of the spinal condition. Where he finds a displaced vertebra he makes a nerve tracing and the nerve tracing invariably leads directly to the organ affected. Thus he can say positively because the tenderness of the nerves leave no doubt that the organ is affected. The result is health.
